The main factors determining average minimum temperature are altitude, latitude, and proximity to the coast.

1. **Zone 1** covers the alpine areas of south-eastern Australia.
2. **Zone 2** the tablelands of south-east Queensland, New South Wales and Victoria, and the uplands of central Tasmania.
3. **Zone 3** includes much of the southern half of the continent, except for localities on or near the coast. Many of our weather stations are on the coast or on offshore islands (some of them are lighthouses) and these are often a zone or two higher than adjacent mainland stations because of the warming effects of the ocean in winter.
4. **Zone 4**, because of this warming effect, covers a broad area from coastal Queensland across the continent to Shark Bay and Geraldton in the west, also includes the Mornington Peninsula, areas adjacent to Spencer Gulf and Adelaide, the south-western coastal zone, Sydney, and the north coast of NSW, along with a number of localities dotted all around the southern coast of the continent.
5. **Zone 5** covers, some of the Queensland coast, Western Australia north of Shark Bay and across the top end.
6. **Zone 6** includes the Queensland coast north of Cairns, Cape York Peninsula, and the coast of the Northern Territory.
7. **Zone 7** is mainly restricted to islands off the north coast.
